

How to add your design

1

Identify Smart Objects

Locate the Smart Objects within the PSD file. These are layers marked with a **green** label & "Double Click to Edit".

2

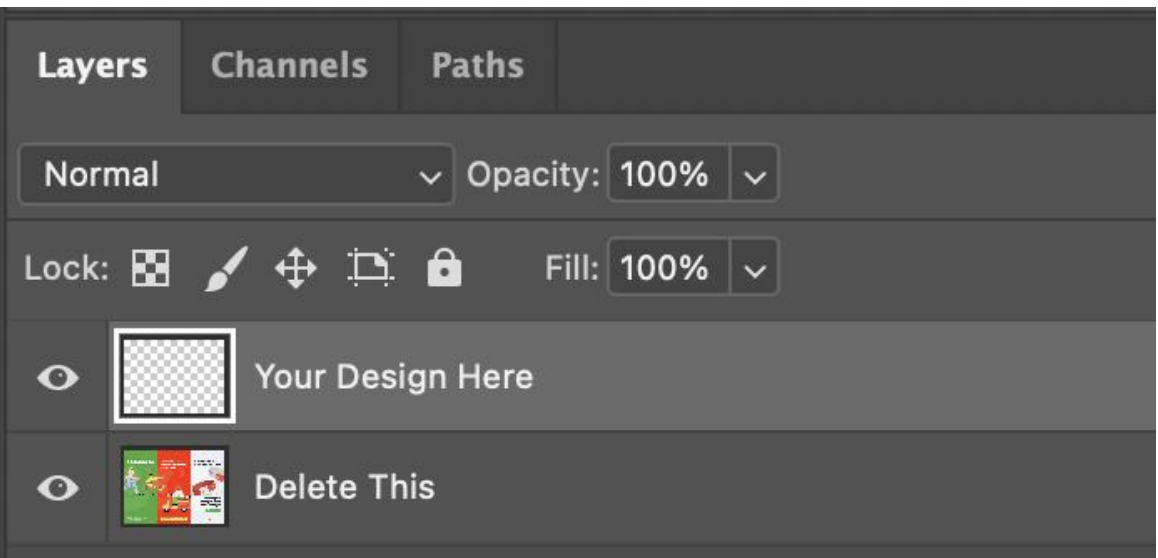

Double-Click on Smart Object

Double-click on the Smart Object layer you want to customize. This will open a new window containing the contents of that Smart Object.

3

Replace Design

Inside the Smart Object window, you'll find the existing design. Replace it by pasting or importing your new design into this space. Ensure that your design matches the size and resolution of the Smart Object

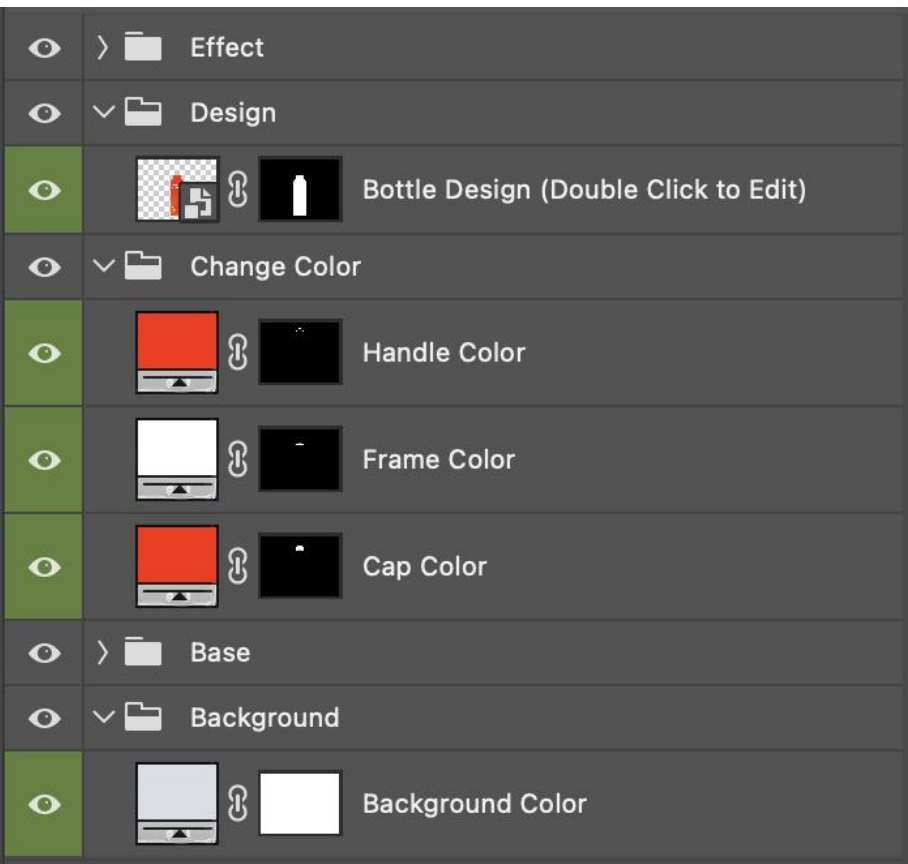

After replacing the design, save the Smart Object window (by pressing Ctrl + S or Command + S on Mac). Close the Smart Object window.

4

Return to Main PSD File

Once you've saved the Smart Object, return to the main PSD file. You'll notice that the design in the mockup scene has automatically updated.

You can also change the color of the object and also the background. The parts that can be changed are marked with a **green** label.

5

Saved Changes

After placing or updating the design on the page component, the corresponding mockup scene in the mockup library will automatically reflect the changes.
